About

Mobile application for Observation App addresses wide range of audience. From adviser, researcher, farmer to any one can be part of this program, who can contribute related observation based on plant health and has **valid user account** in NIBIO's **VIPS Logic** system.

Features

Some key features of the app described below for your kind reference :

1. Observation collected from this mobile app can be well synchronized with VIPS Logic server and vice versa.
2. This app can easily record the location based on user's permission and choice.
3. Observation images can also be shared to VIPS Logic system.
4. Existing **Point of interest** can be well visible, editable through this app. User can even create their own point of interest of their chosen field/farm for easy of reference.

Availability

Currently the app is available for **internal testing**. Therefore only selected registered users are allowed for this internal testing program. We are now in alpha phase of testing. We are expecting some issues to be reported by the users and happy to address those for phased released and making the application more usable.

Platform

At this phase the app is only available in **Google Play** for **Android** users. We are positive to release for IOS (I-Phone) users in near future.

Access procedure

Access for Google Play

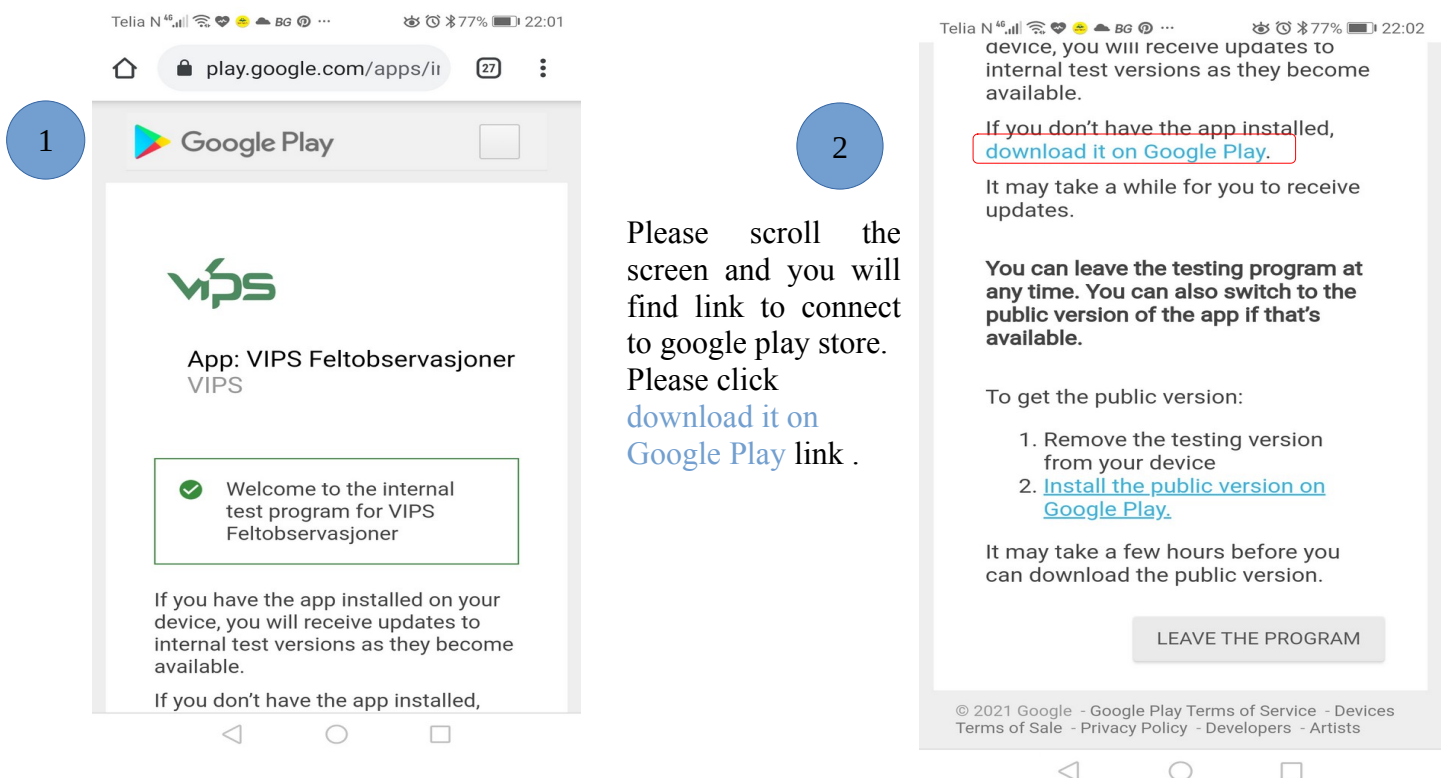

Invited user's might receive an link to get the app from google play.

The link might be : <https://play.google.com/apps/internaltest/4700478055302598030>

As per present requirement, users need to register their google account to the VIPS Team to access the app.

You are requested to click the link from your mobile (Android) only and not from desktop computer.

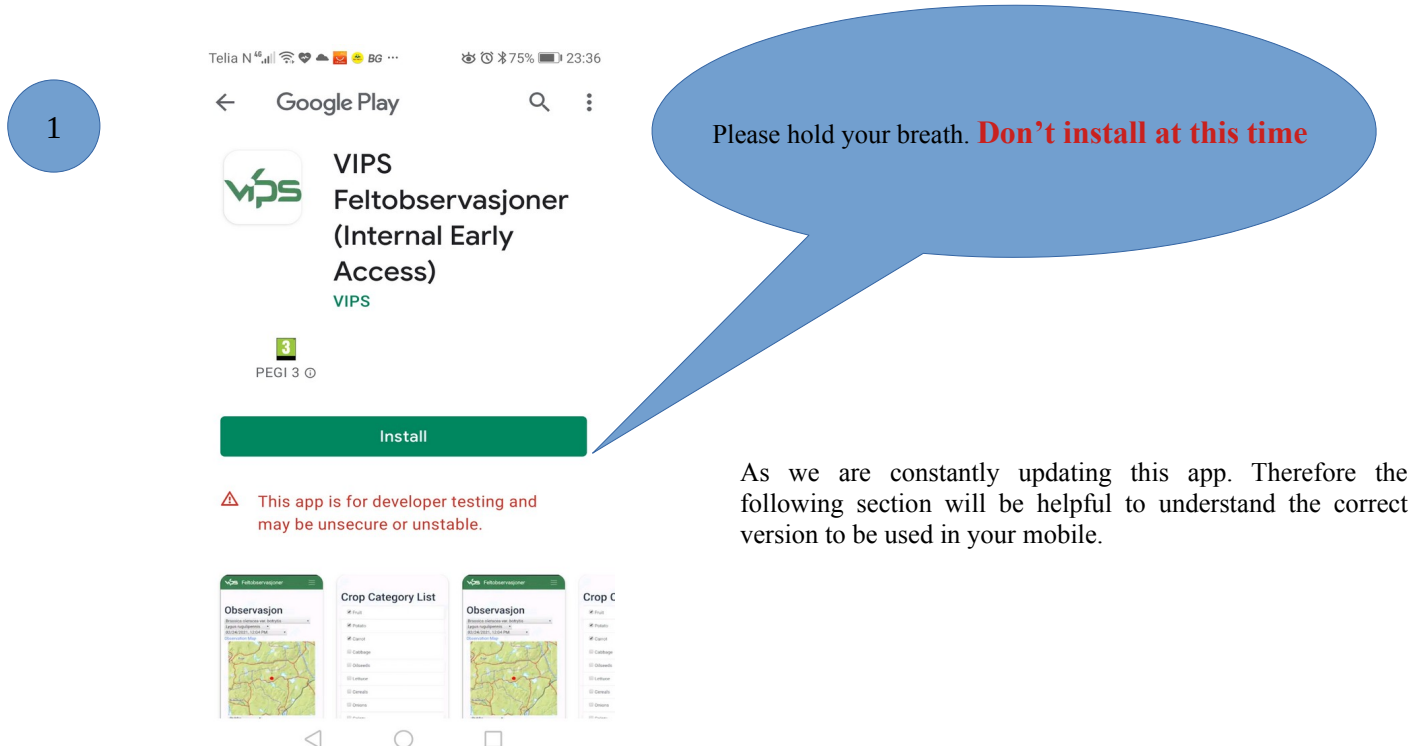

Upon clicking the link shared in invitation email you will find the following screen :

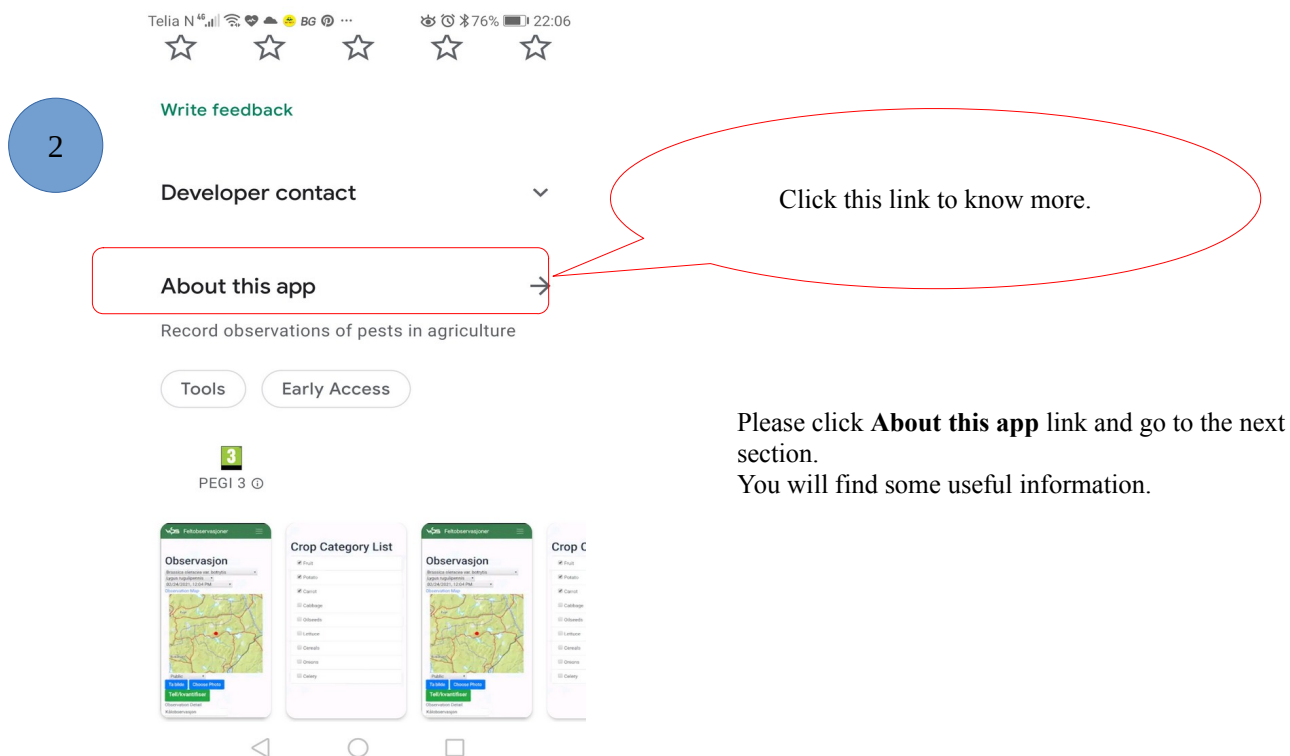

Install from Google Play Store

Now after click above mentioned link you should be in google play store

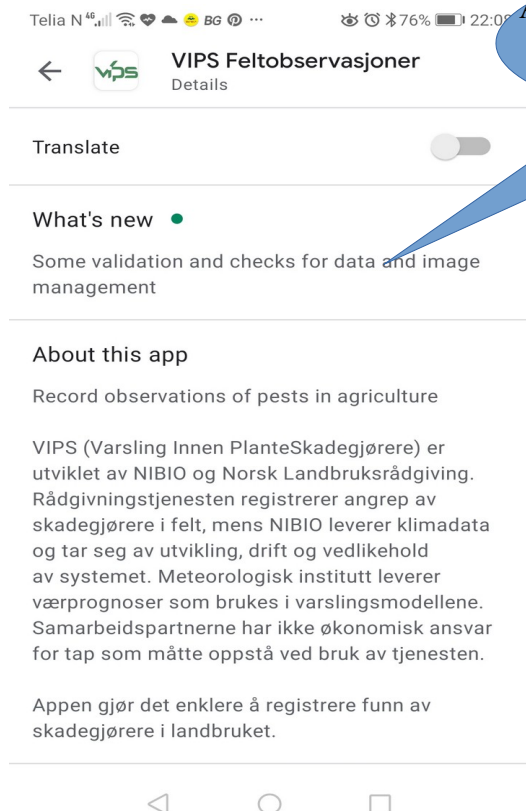

You screen should look like following :

Now please scroll a little and you will find some more feature :

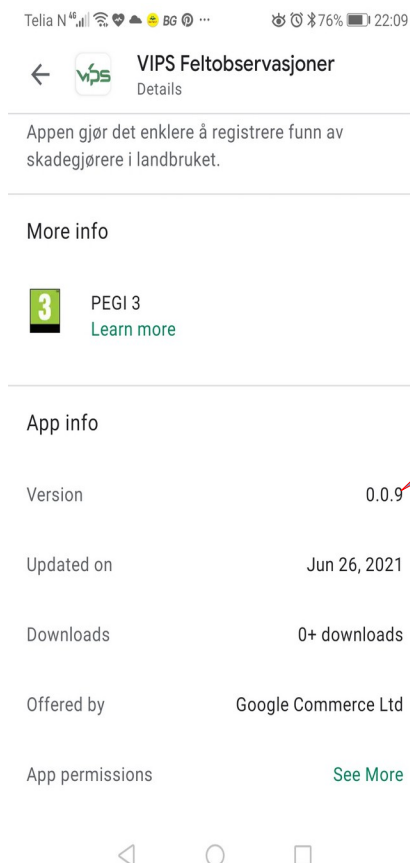

Now this About page is little interesting.

Any **information** for new version might published here from development team
In this **What's new** section

Now scroll a little and you will find the version information.

Here you will find version and update date.
This version information is very important to know
whether you are using our recommendation on latest version.

If you need to install latest recommendation version, need to compare the version mentioned here.

It's observed, that based on your installation, it might show previous version. In that case you need to uninstall the app. Close this installation page and come back again. You will find the correct version to install.

Once your data **synchronized** to server, will not lost.

Now it's time to install. Please go back to earlier screen and install.

Install

⚠ This app is for developer testing and may be unsecure or unstable.

Please Install the App now

Wish you good luck !!

Next page onward will explain operation procedure of the app.

Operation Procedure

This and following sections will explain operation procedure of the app. It's easy. It's advisable to follow the guidelines to overcome any issues.

Welcome Screen

This is the App welcome screen with VIPS logo on top left and a hamburger menu on right

You need to click on the menu to get login screen.

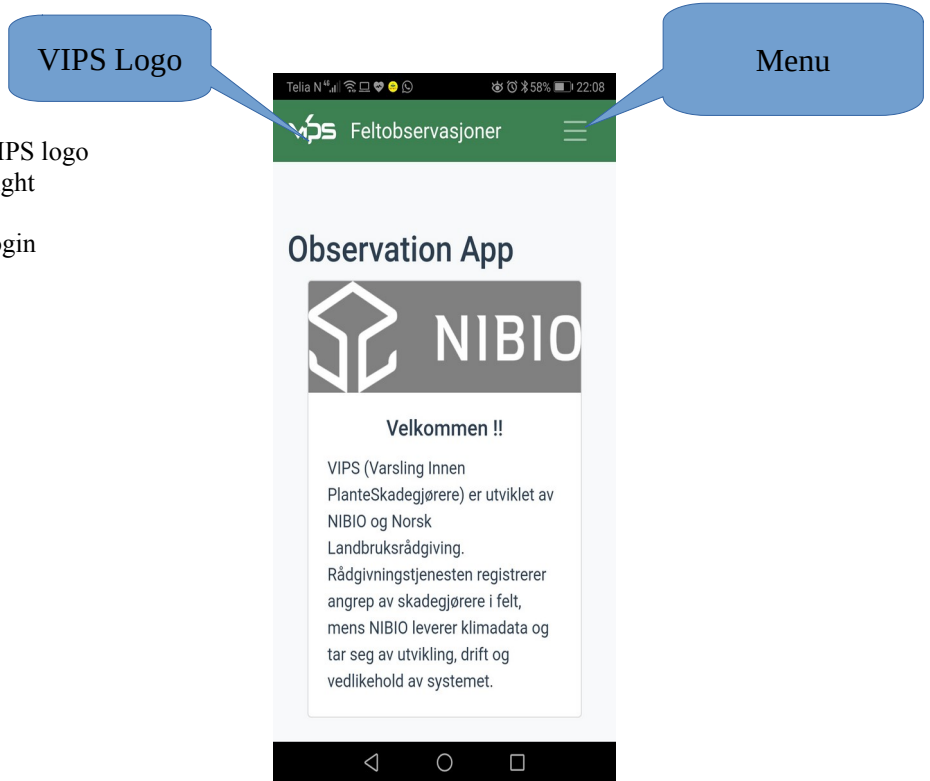

Image : s_001

Login Screen

VIPS Observation APP is a login based system. It will use the same login as of with your VIPS Logic.

For Internal testing you should use your **VIPS Logic test login** (<http://logic.testvips.nibio.no>) and **not the production login**.

I would like to request you to use your VIPS Logic test user login id and password to access this mobile application.

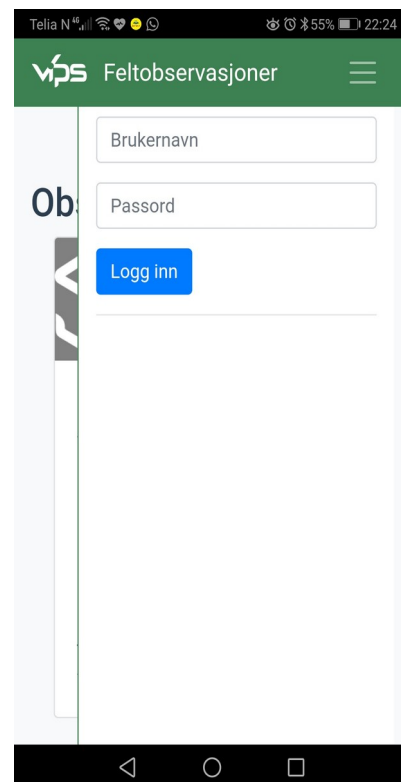

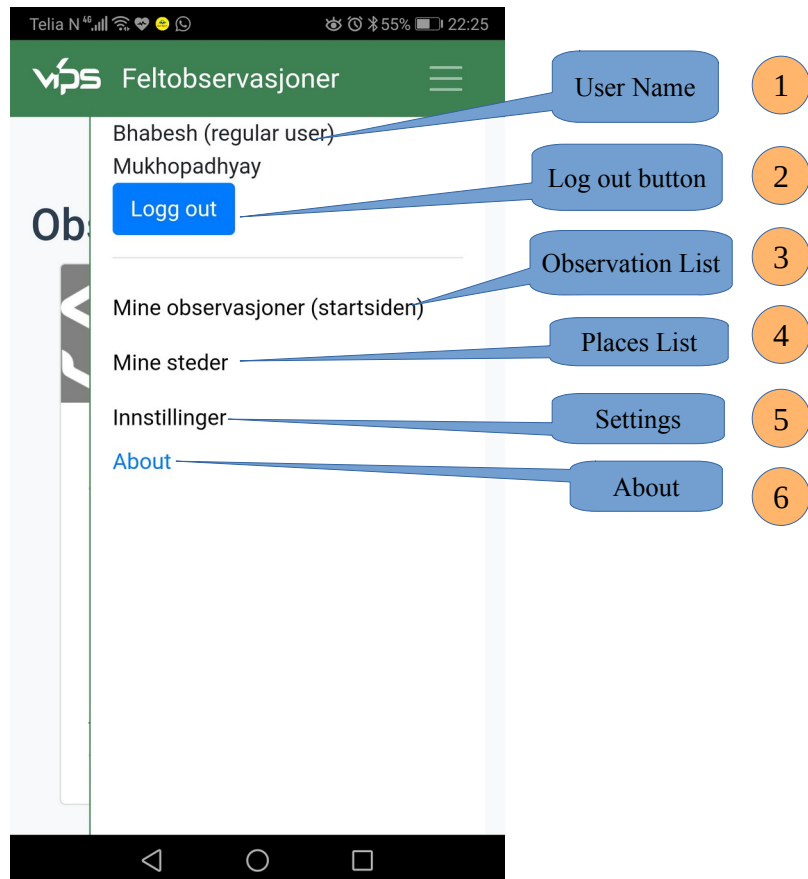

Image : s_002

Menu Items

Menu items are available only after **successful** login.

Following components are available after successful login.

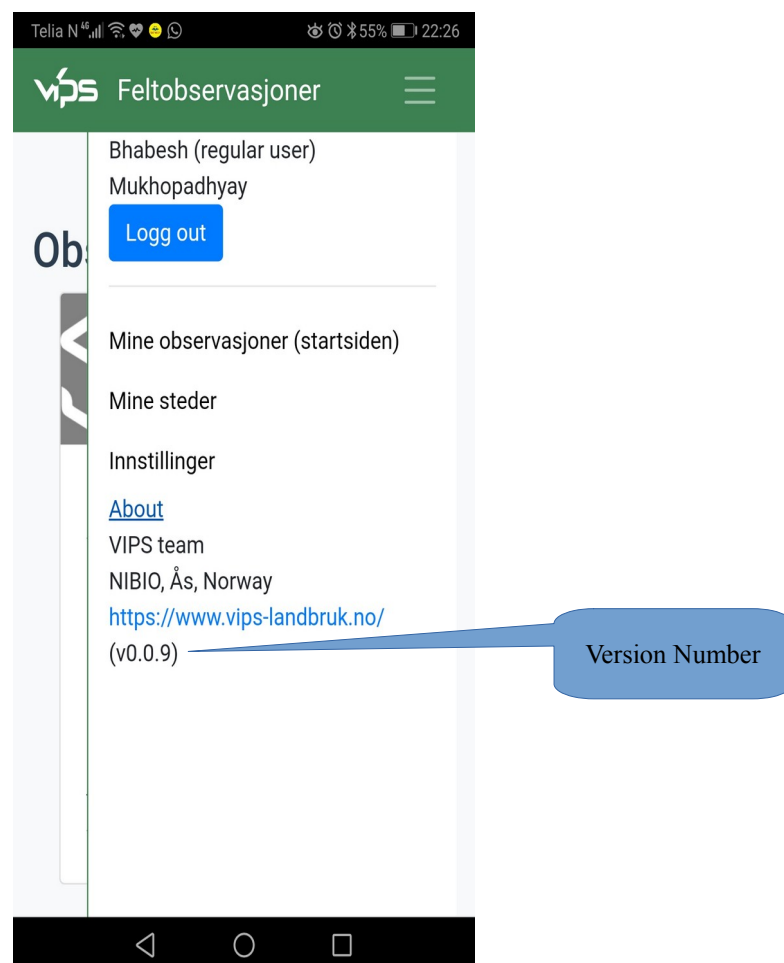

1. Top part shows user name
2. Log out button
3. List of Observations
(Here you will create or pull observations from VIPS Logic)
4. Places list (List of Point of Interest)
5. Settings
(Here you can set crop category and synchronization with VIPS Logic Server)
6. About
(Here you can see app's version number)

About

About section shows some information about VIPS Team and **version number**.

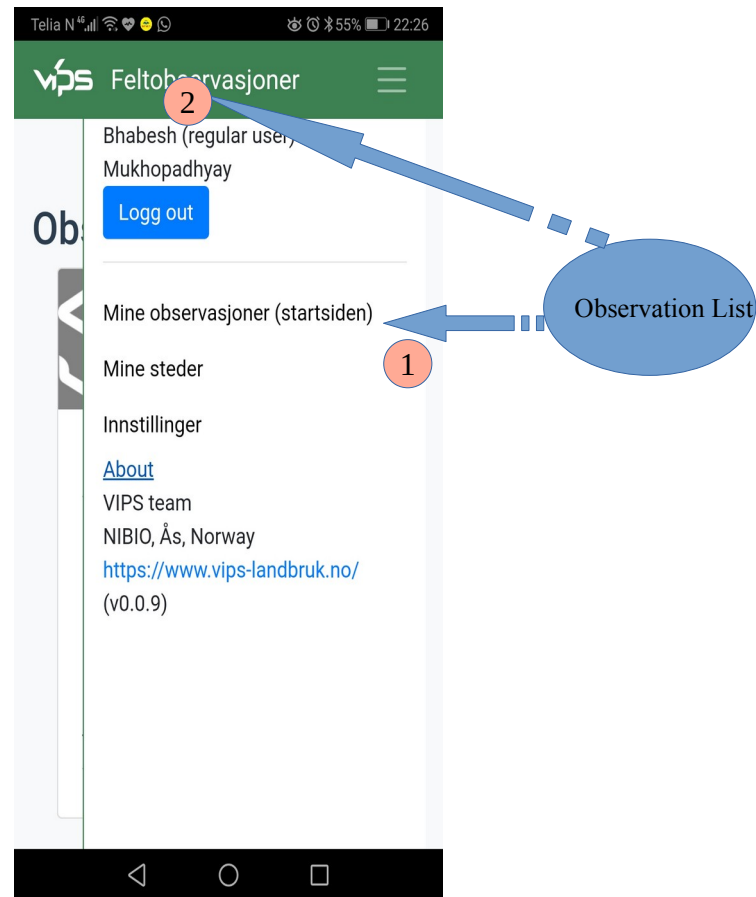

Version number is very important to understand whether we are using the latest system or the app need to be updated to get the correct one.

Observation list

Your list of Observations can be obtained by clicking either of two places.

1. Within the menu option
Named : **Mine Observasjoner (startside)**
2. On the top after the VIPS logo
named : **Feltobservasjoner**

New Observation (Empty crops)

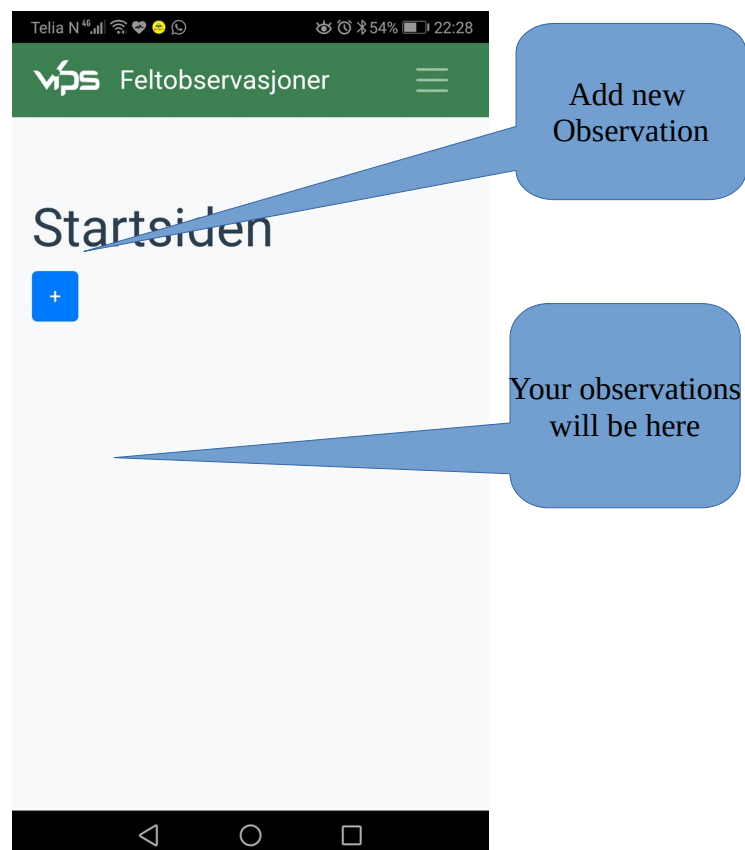

Your all existing observations can be viewed here.
You can add, edit and remove your own observations.

Top of your observation list, there is option to add new observation.

At the very beginning you might find no observations. That's OK, if you don't have any.

Here you will find one blue plus (+) sign.
Clicking this sign will allow you to add new observation.

I would like to request you to click to add a new observation.

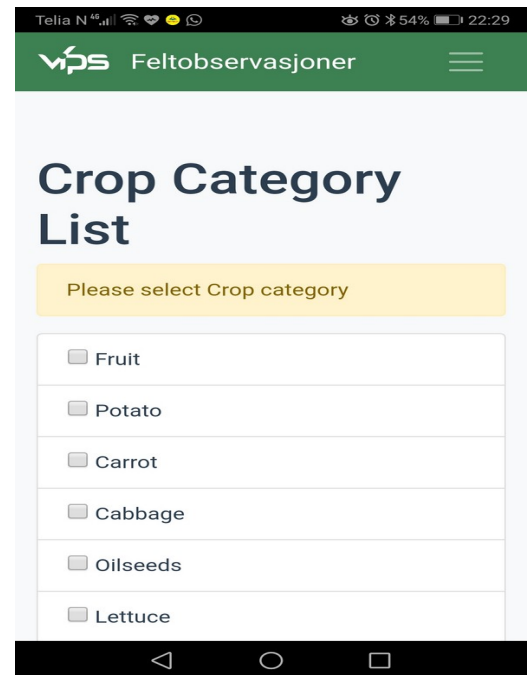

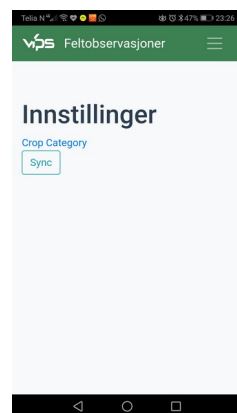

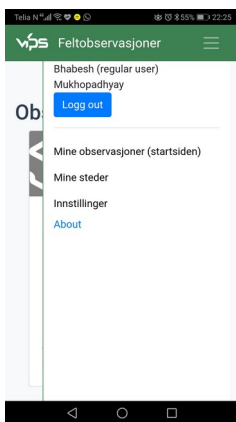

Crop Category List

It's possible that if you didn't select **Crop category** for your observation/s then you might face this screen at the time of creation **new observation**.

This **Crop Category List** screen can also be achieved by clicking **menu -> Settings (Innstillinger) -> crop category**

(screen images given below for reference)

Crop Category

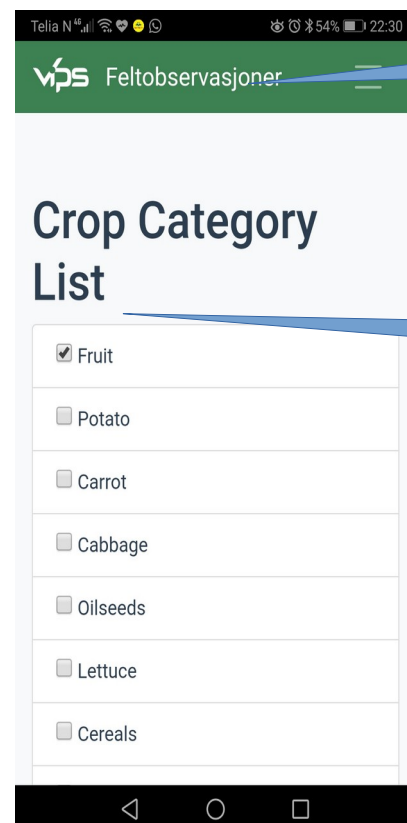

In **crop category List**, you can select one or multiple category. Even you can select all the crop categories too.

It's advisable to select only the category required to shorten the list of crops to choose at some other point of time.

One interesting thing is, if your existing observation/s does not have the selected crop category, still they will show the crop category the has and will work perfectly.

I would like you to click

1. One or more crop category.
(Here I select **Fruit**)
2. Click Observation List **Feltobservasjoner**

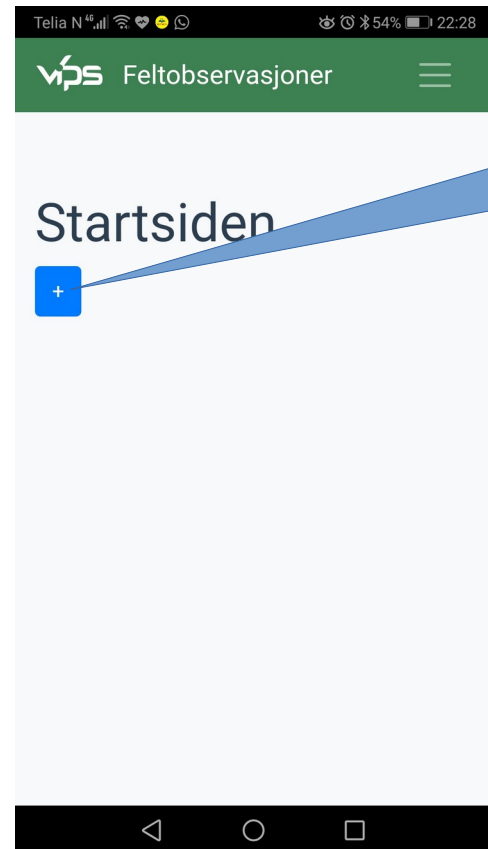

Back to
Observation List

Select
Crop Category

Create Observation

Now you are back to Observation List again.

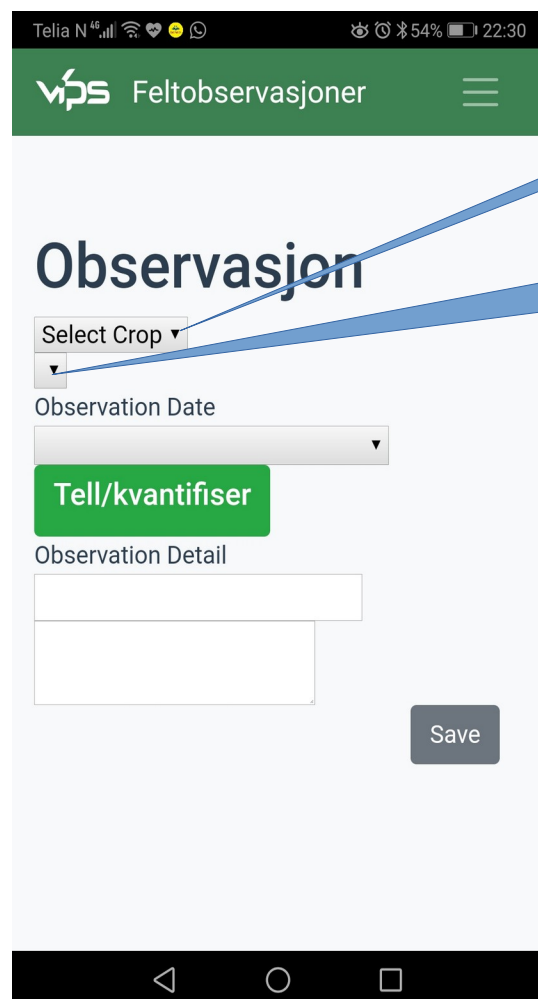

To create or add a new observation please click one blue plus () sign, which will allow you to add new observation.

WELCOME !!

At this stage, user can start using selecting crop.
Pest can not be selected without select the **Crop**.

Click on **Select Crop** drop down

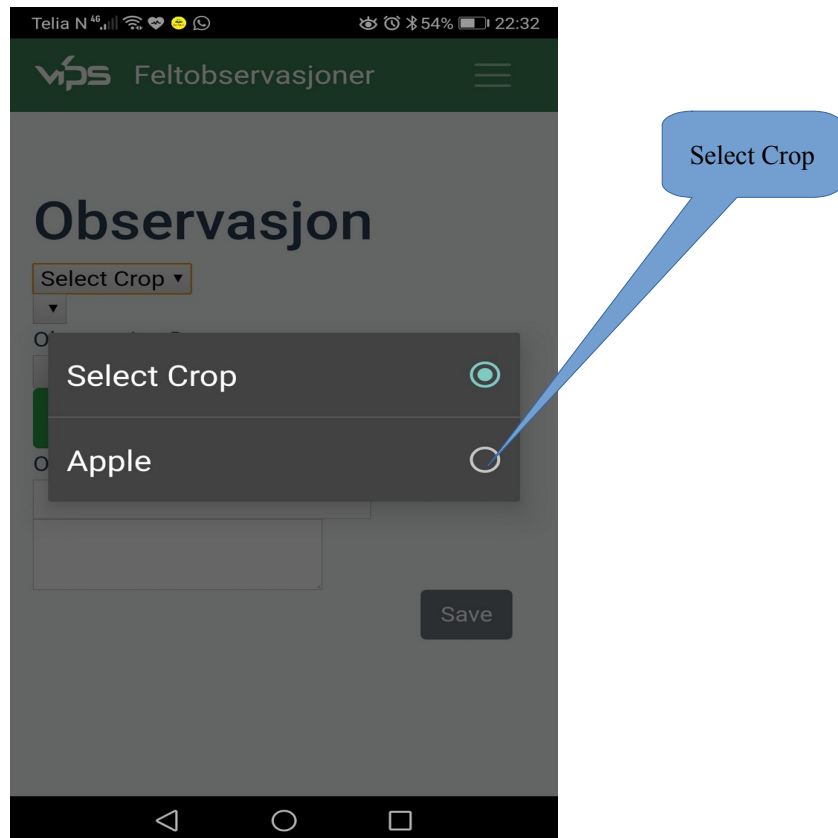

Crop

Clicking on **Select Crop** drop down will open a popup window with list of crops.

The list of crops actually comes from list of **Crop category** selected earlier.

Previous screen **Fruit** selected as crop category. Therefore in new observation available crops are within that crop category. In this case it is **Apple**.

Please click the available choice of crop

After successful selection of crop, a dropdown list for **Select Pest** will be visible.

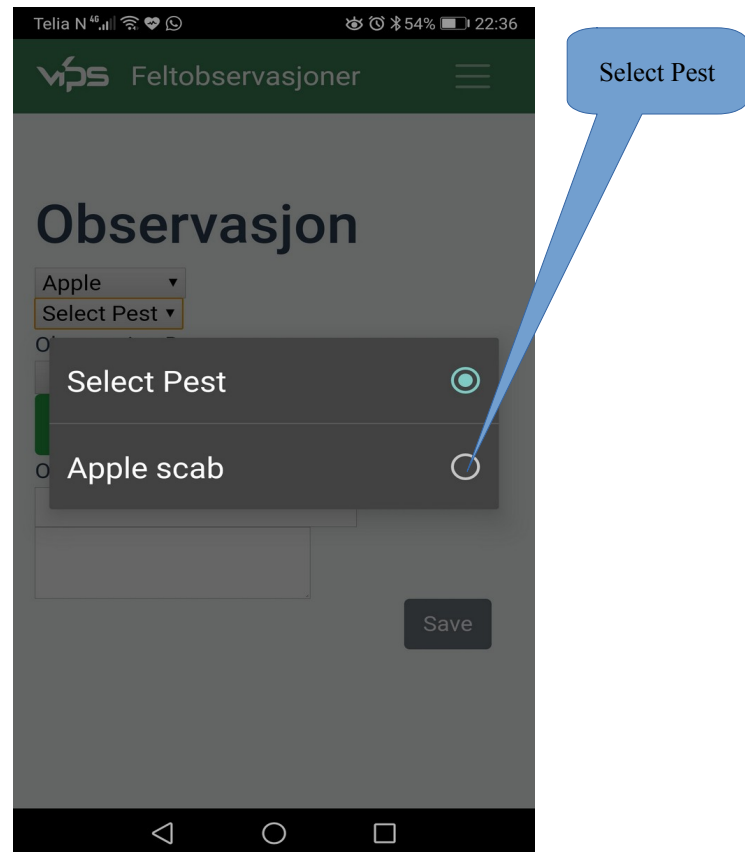

Pest

Based upon crop a list of pest might be available after click the drop down for **Select Pest**.

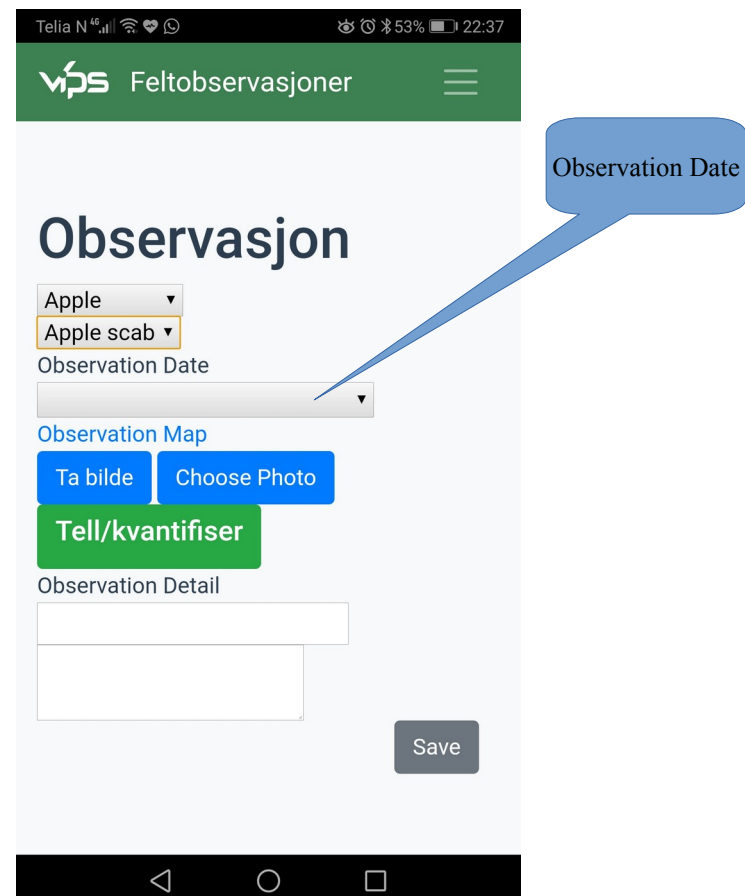

Please don't be surprised if you couldn't able to see any pest of a particular crop. Sometime some crop are not recorded with attached pest/s.

Click on choice of available from list of pest

After crop and related pest selected, it's time to record Observation Date.

Please select **Observation Date**

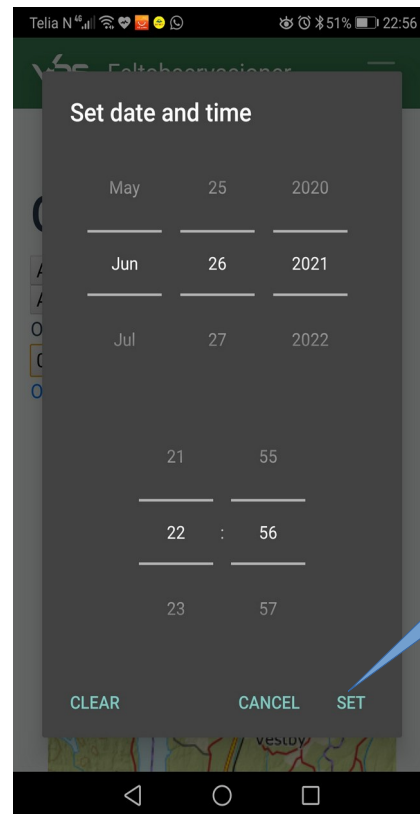

Observation Date

When you click **Observation Date** dropdown, a popup window for **Set date and time** will be visible.

Normally it shows current date and time. You can browse other date and time too.

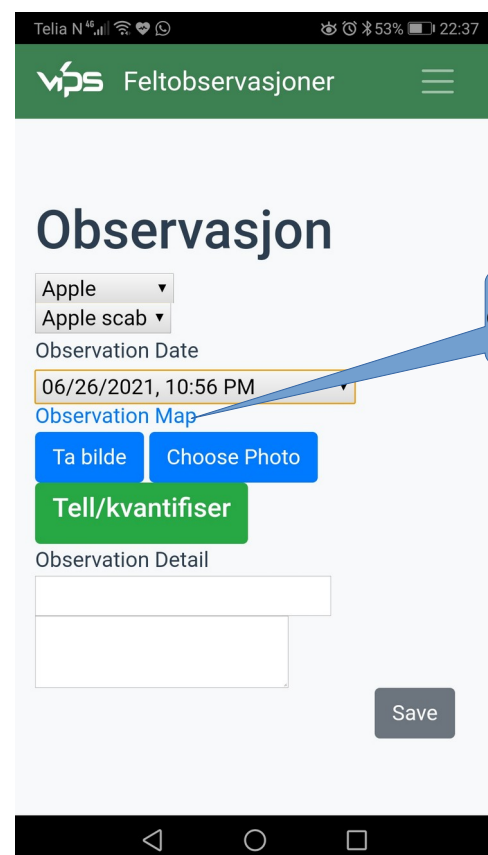

When done click **SET** button.

Now Observation Date will be visible.

Now it's time to set the location.

Please click **Observation Map**

Observation Map

Click on **Observation Map** link bring a new window which shows Norway Map.

Top left of Norway map is a **Back** button in green color. Where as in top right there is a black circular button is there.

That black circular button is position button, which will show user's present position.

User need to give consent/permission to allow the mobile application to access the device's location to use the in build GPS system.

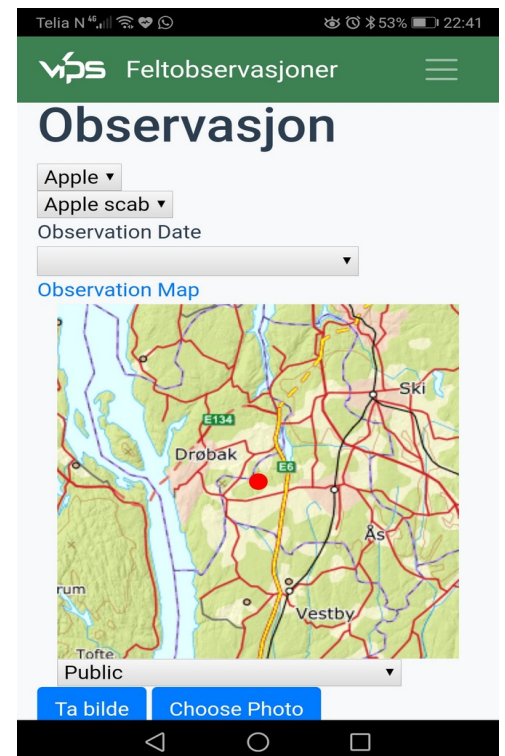

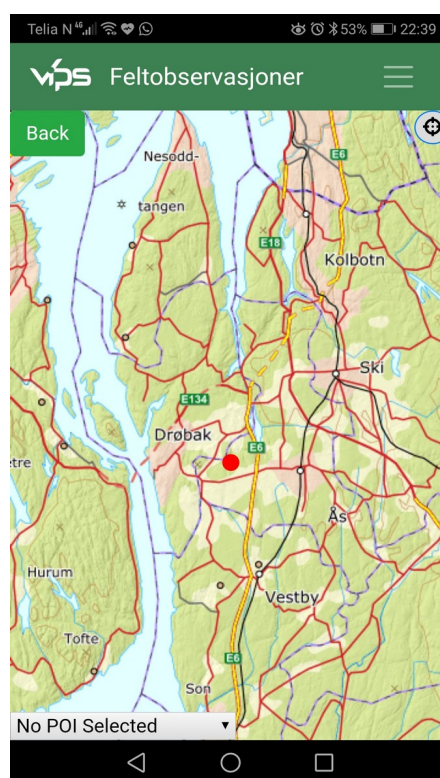

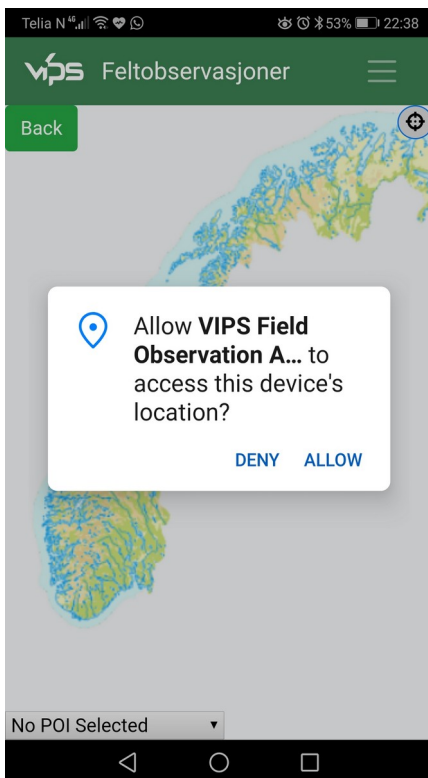

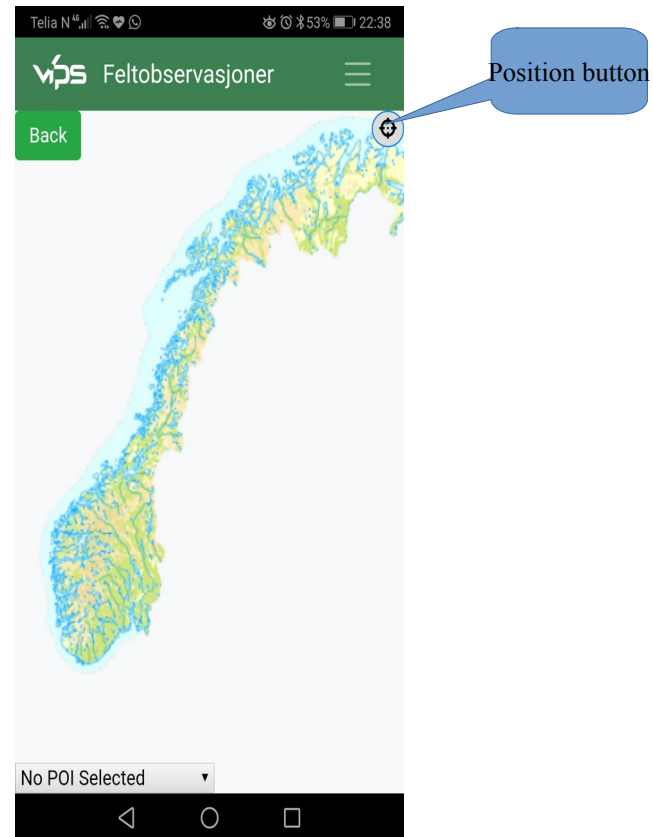

Once permission **allowed**, user's current location displayed on the map.

However user is free to choose other location by using his finger and tap to fix the location. Zoom using two fingers possible and permitted.

To get back to ongoing observation, please click the back button.

In **Observasjon** screen user selected map will be visible.

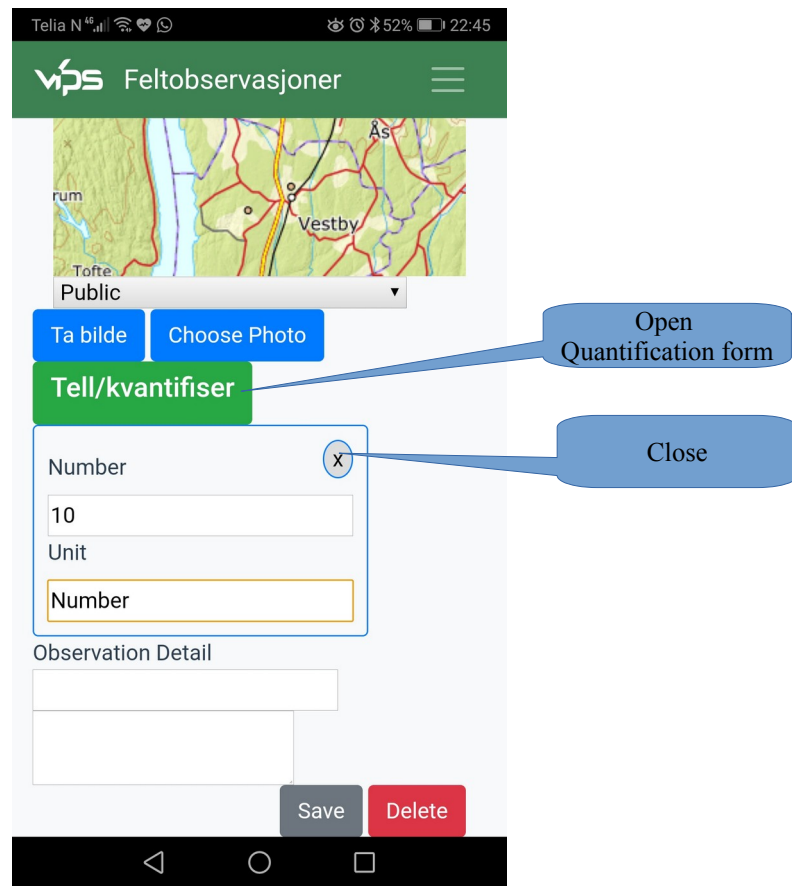

Note: Map here is not editable. To edit you need to click **Observation Map** link again.

Quantification

For dynamic quantification please click the green button (**Tell/Kvantifiser**). After filling the form user can close it by clicking X button.

This quantification is not mandatory, therefore user can skip it if not required.

The screenshot shows the 'Tell/kvantifiser' form in the VIPS Feltobservasjoner app. The form is open, showing a map in the background. The form has a green header with the VIPS logo and the title 'Feltobservasjoner'. Below the map, there are buttons for 'Ta bilde' and 'Choose Photo'. The 'Tell/kvantifiser' button is highlighted. The form contains a 'Number' field with the value '10' and a 'Unit' dropdown menu set to 'Number'. There is a close button (X) in the top right corner of the form. Callouts indicate 'Open Quantification form' pointing to the green button and 'Close' pointing to the X button.

Save

User now can see **Observation Detail**.

It's now possible to save the form.

Note :

User can take the photo at this stage or before. But I would like to request to hold it and don't do it now unless sync with VIPS Logic server. In this way this observation will be mapped with server and latter taken any image will be properly mapped.

Very soon we will do our photo beautiful photo session. Please wait till then.

Please click **Save** button.

The screenshot shows the 'Tell/kvantifiser' form in the VIPS Feltobservasjoner app. The form is open, showing a map in the background. The form has a green header with the VIPS logo and the title 'Feltobservasjoner'. Below the map, there are buttons for 'Ta bilde' and 'Choose Photo'. The 'Tell/kvantifiser' button is highlighted. The form contains a 'Number' field with the value '10' and a 'Unit' dropdown menu set to 'Number'. There is a close button (X) in the top right corner of the form. Callouts indicate 'Observation Detail' pointing to the text field.

New Local Observations

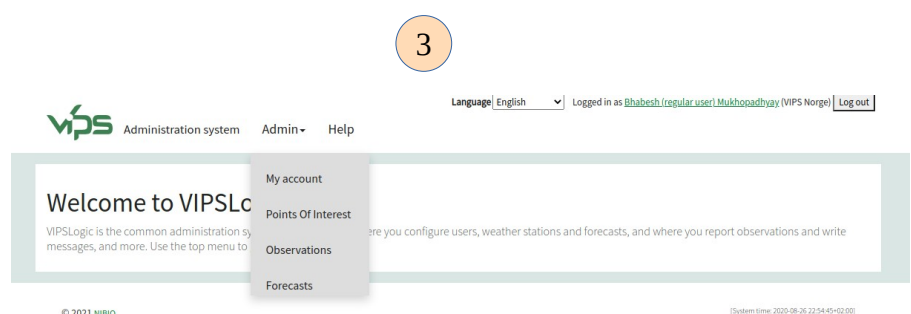

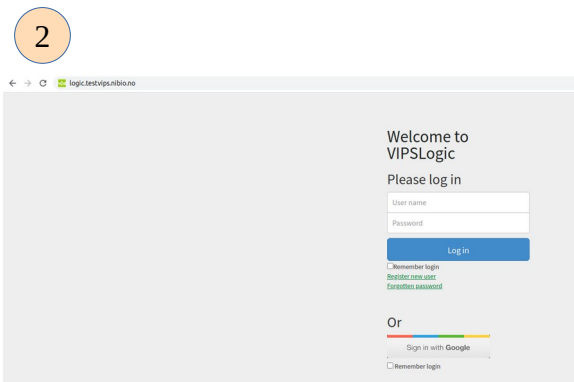

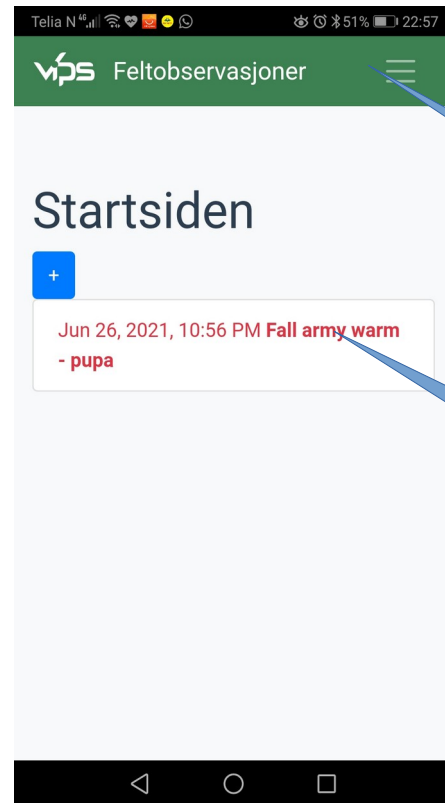

When a new observation created in mobile application (i.e. not in VIPS Logic Server), and saved, listing shows in **red** color.

1. Listing in **red** color indicates it's new locally created and still not sync with VIPS Logic Server.

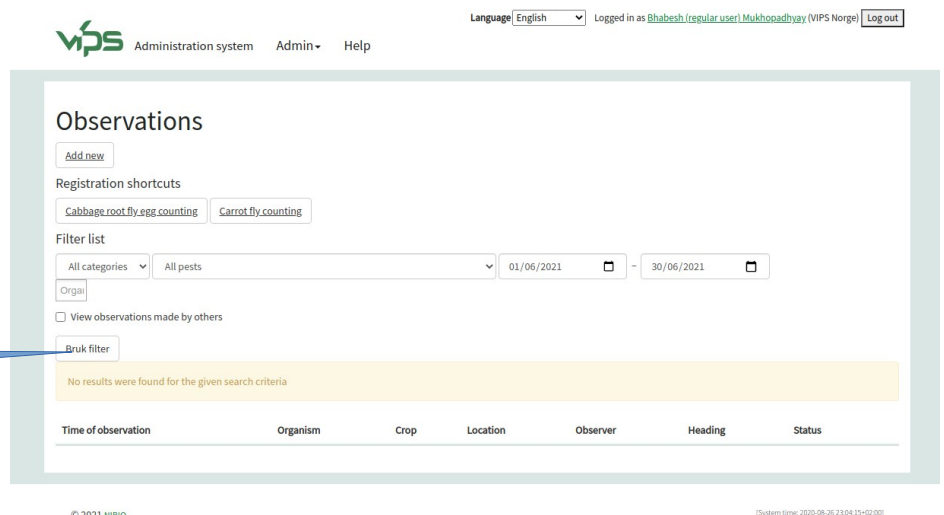

At this stage if you want to see what happened to the VIPS Logic server, will find no as such related records there still.

2. To confirm please login to <http://logic.testvips.nibio.no> with your test VIPS Logic user id and password
3. From **Admin** menu select **Observation**
4. Select range of dates to cover the newly created observations. And click the filter button. Hopefully, you will not find any related record still their.
5. To **sync** with VIPS Logic Server, we need to click the **Sync** button in Mobile application's settings (**Innstillinger**).in menu.

Please click Menu to reach settings (**Innstillinger**) in mobile application

Filter button

Sync (Synchronize)

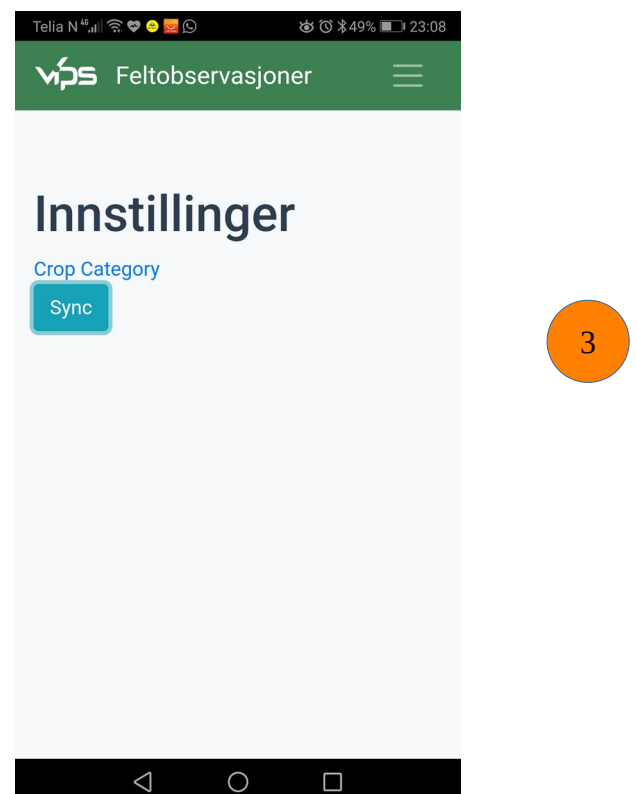

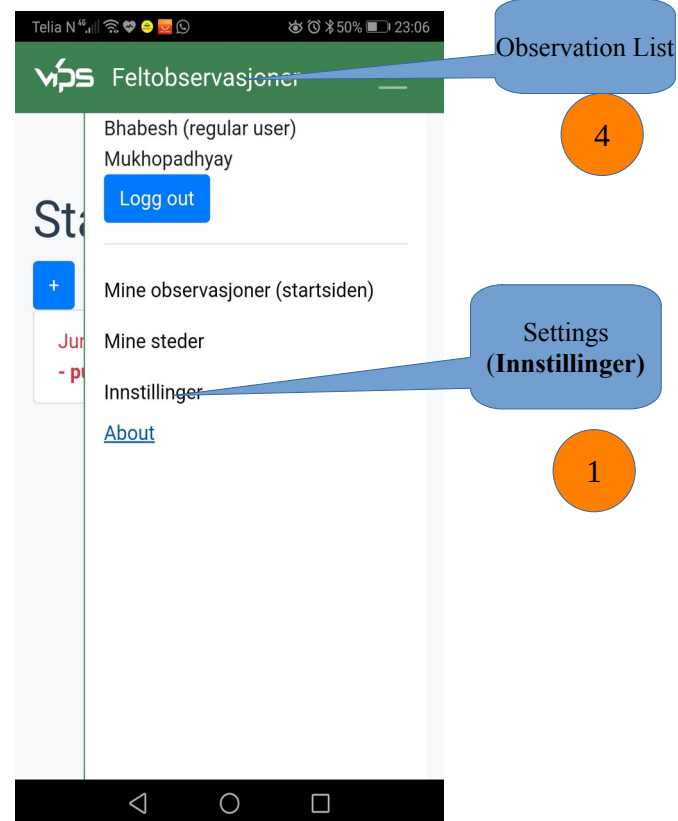

Sync or **Synchronization** is the process to transfer the data two way between server and mobile application such a way that both the places should have equal amount of data.

It helps VIPS Logic server to get the observation data and analyze on it, other hand it helps user to get any data modified/created in server to be available in mobile app.

At present Sync is a user driven process. In near future, it will be full automatic without user's any intervention.

1. Therefore to activate **sync** user needs to click settings (**Innstillinger**)
2. You will find **Sync** button under crop category
3. Please click the **Sync** button. It's background will change to **Sync**. It means button clicks and background process start working for syncing data.

4. Please click Observation List (**Feltobservasjoner**) to back to see the list of your observations.

Existing Observation

1. Now you can see your observation which was color **red** now turned to **green**.

Green color indicates, your observation successfully synced or mapped with VIPS Logic server.

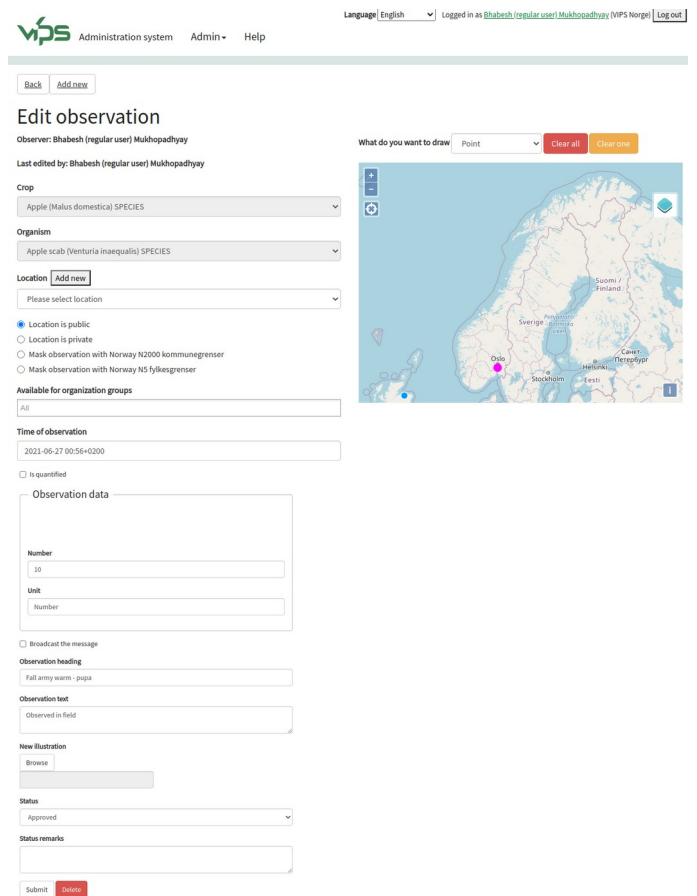

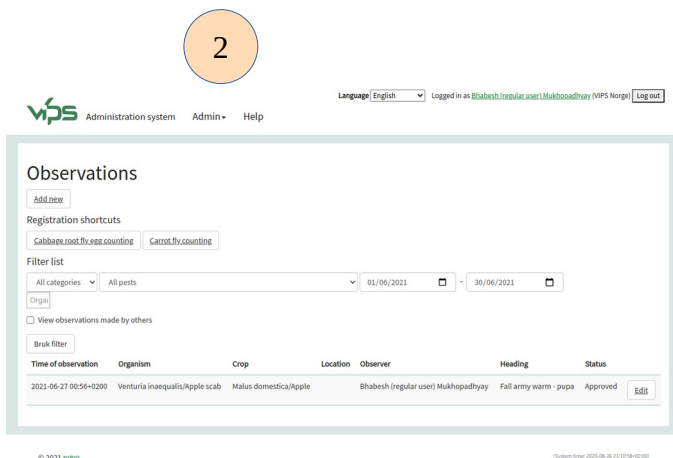

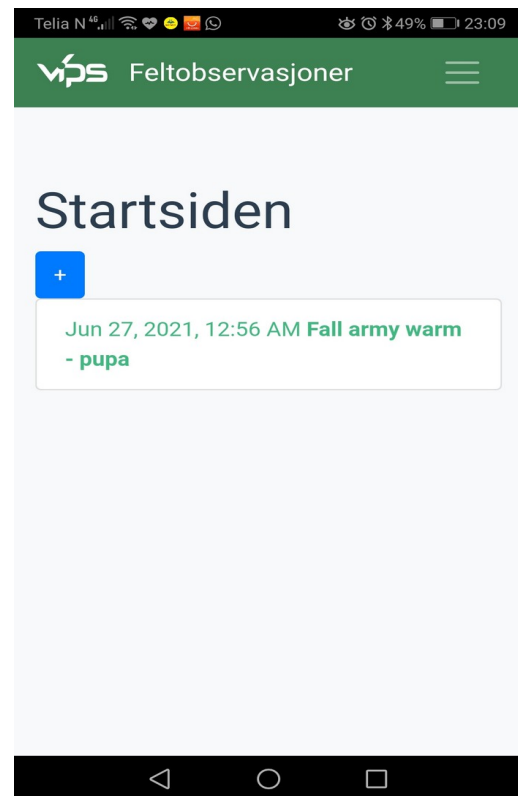

To confirm, please login to <http://logic.testvips.nibio.no/>

From **Admin** menu select **Observations** in **Filter list** choose range of dates to cover your observation taken . Click Filter (**Bruk filter**) .

2. You will find your observations here. Please click **Edit** button to details of the Observation.

3. You will see your detail observation. Including position in map, quantitative data, and your observation details.

You can modify your data here and using sync in mobile application your modification will be available in mobile application too. I suggest, not to do this now. First we need to see more features in mobile application.

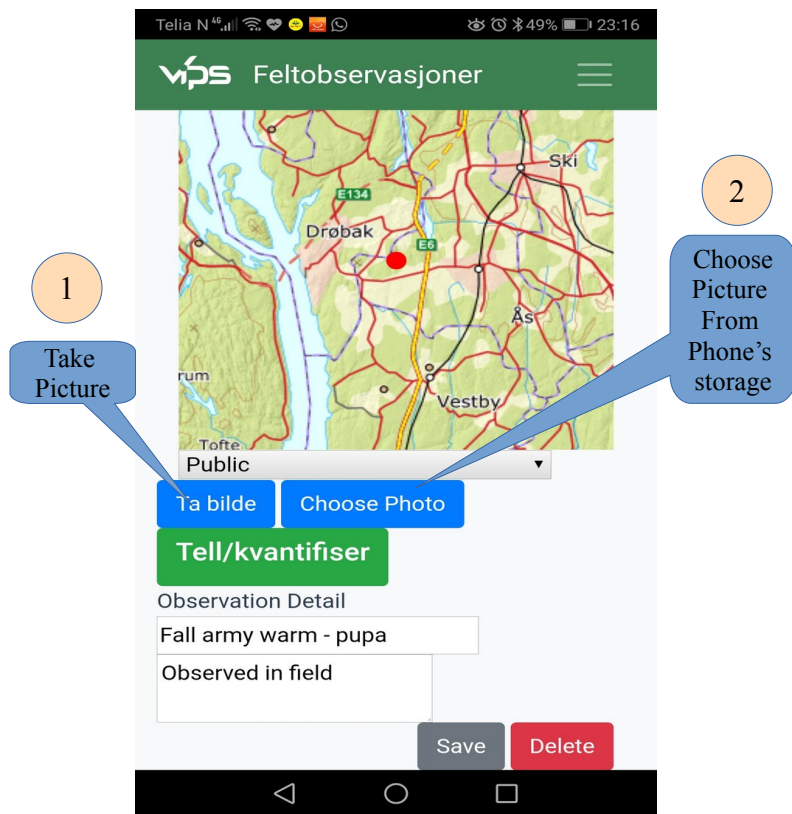

Capturing Images

Images are interesting and might consider a important part of observation.

In this section we will find out options and way to capture or include images through Observation mobile application and contribute to VIPS Logic server.

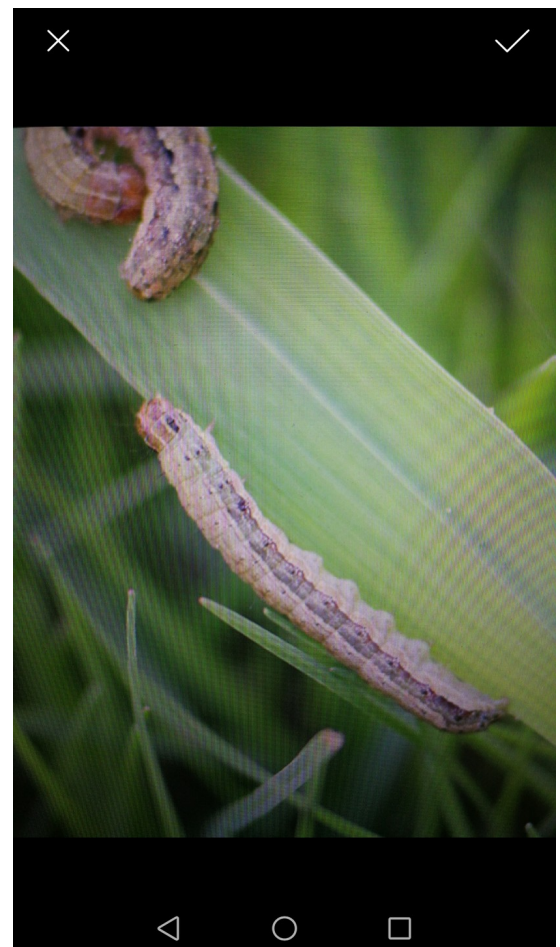

1. It's possible to take photo directly from phone camera for observation app.
2. It's also possible to include previously captured stored images in your phone storage.

To take photo/image using built in system, please click **Ta bilde** button of any open observation of your choice.

You can use front or back any one of your camera. After taking the picture, you will find a check mark on top right and X mark on your top left. X mark used for canceling the selection where as you can save the image using the check mark on your right.

To save the picture please click the check mark on top right

Save/Delete Image

The moment you click the check mark on top right after capturing image, it automatically save into your mobile phone and mapped with a related specific observation.

After saving the screen will back automatically to Observation with thumbnail of that same image.

But it's still advisable to click save button of the observation to let the system know for future **Sync** process.

You can click the image to see enlarged view.

To delete or remove an image, user need to click the **X** button on top right corner of every image.

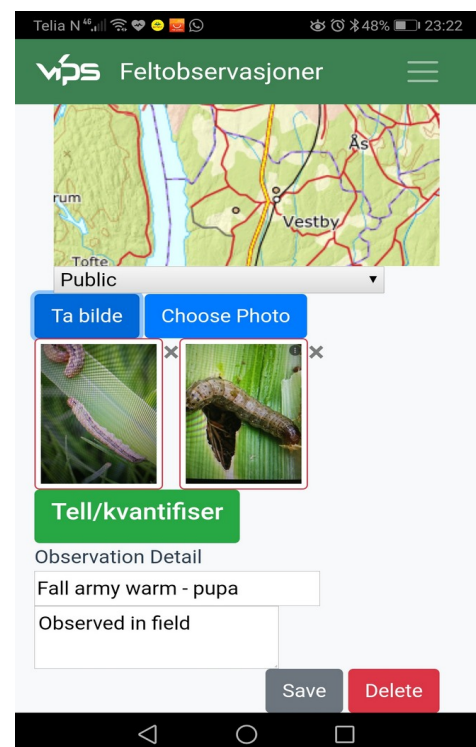

Multiple images can be captured.

Any newly image captured will be with **red** boundary.
Any existing image will be with **blue** boundary.

But the moment a observation sync with VIPS Logic server, there will be no color boundary.

Now it's time to sync those images captured with VIPS logic server.

To achieve this you are requested to click save button.

Updated Local Observations

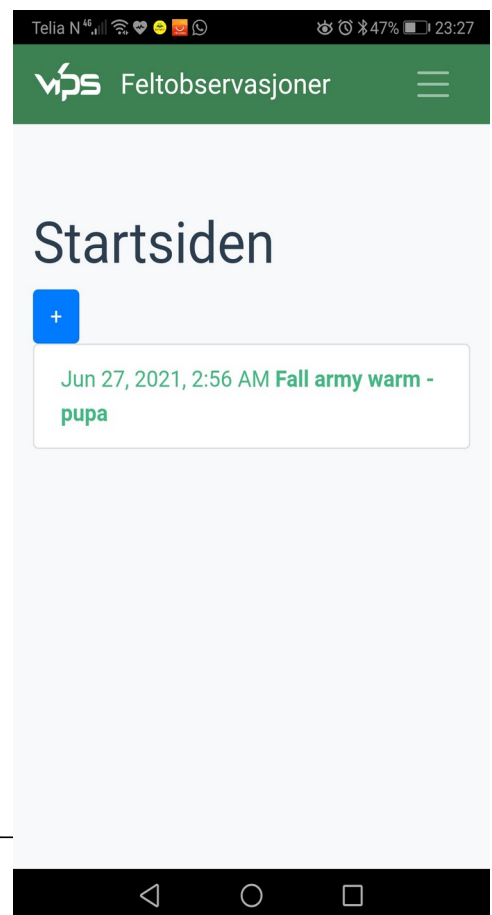

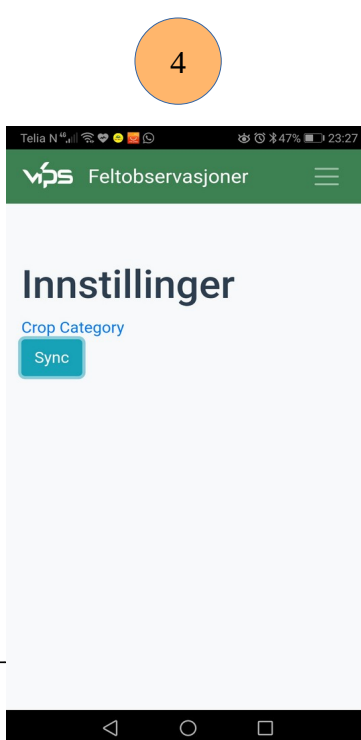

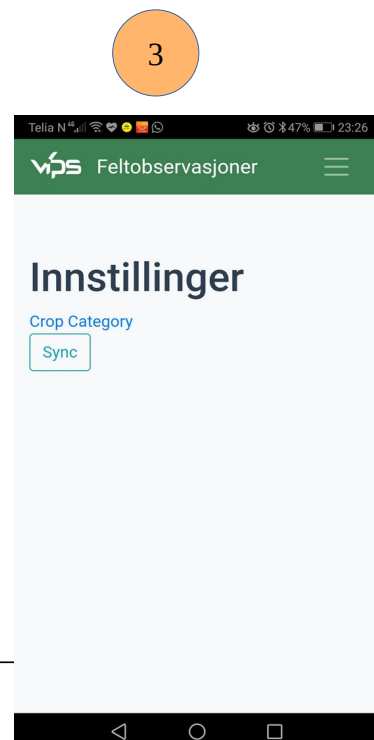

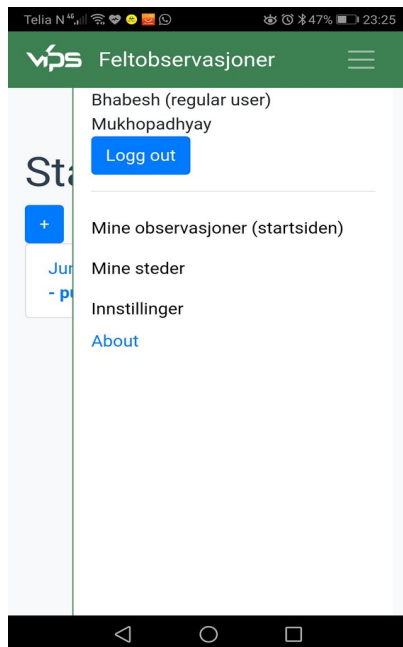

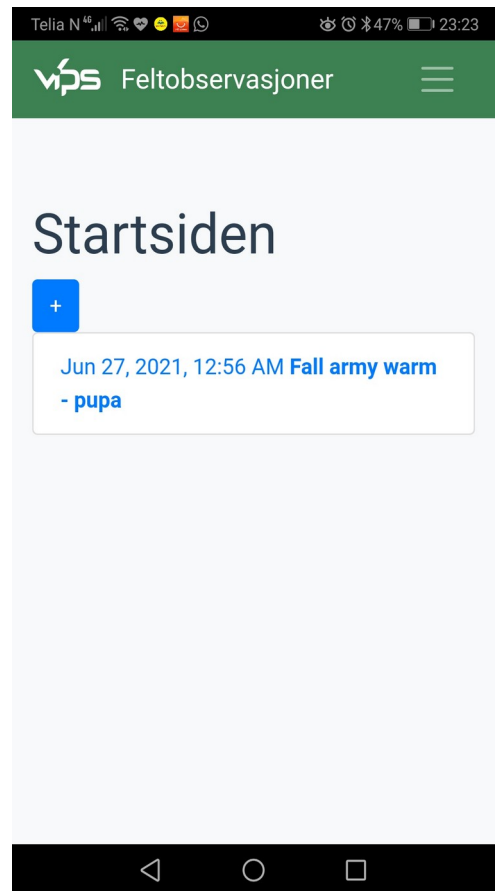

After saving an observation, Observation list comes in front.

Any existing observation will be turned **blue** after edited locally.

This blue color indicates this Observation exists in VIPS Logic server but needs to sync again to push its local changes (e.g. adding/deleting images, editing data etc) with VIPS Logic server.

Therefore to achieve this need to sync again.

Please click Menu / Settings (Innstillinger) / Sync to sync/transfer the information.

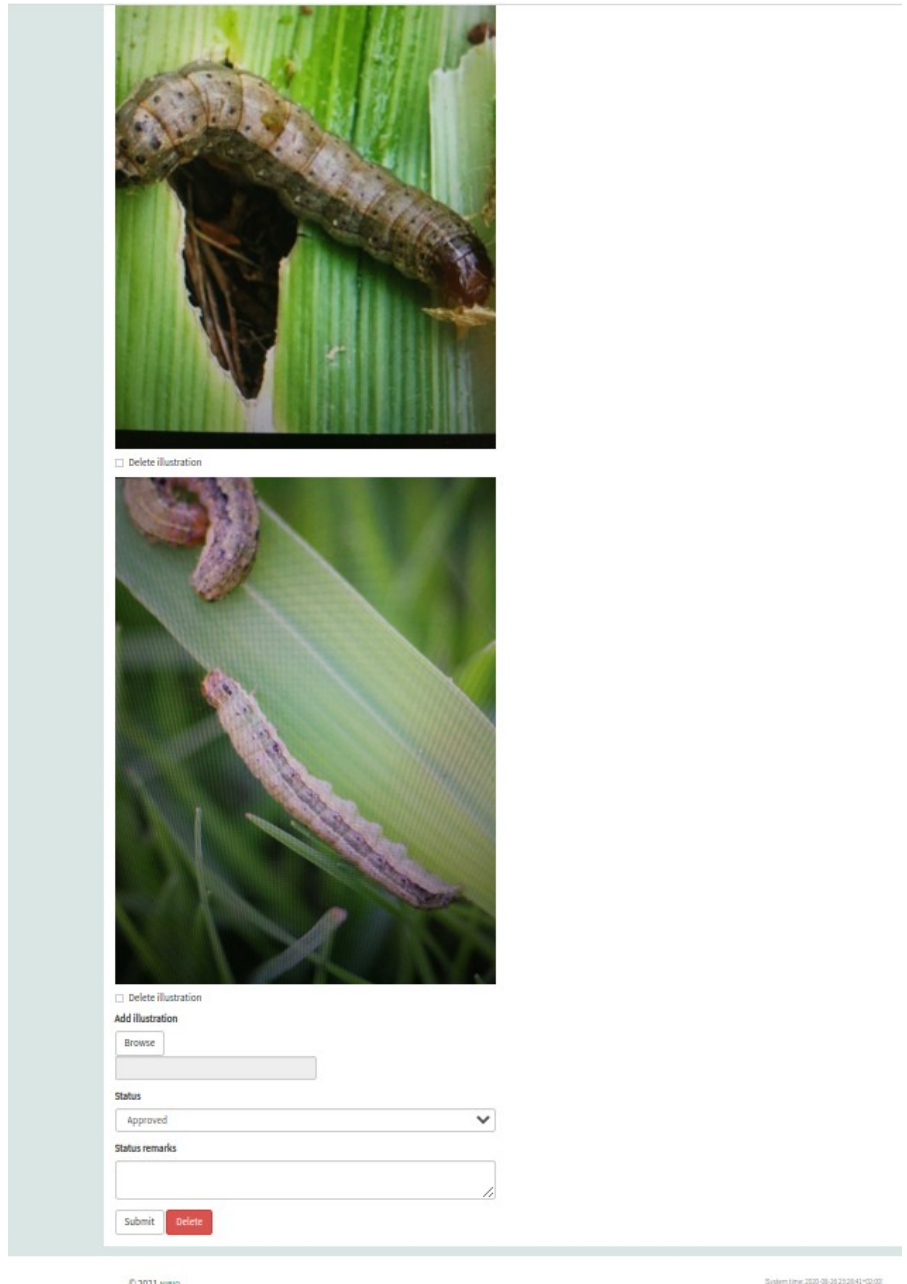

Server update

To confirm sync, please open VIPS Logic test server using your id and password with the following url :

<http://logic.testvips.nibio.no>

Search your particular existing Observation. Open the observation using edit button and you will find the images what you added in your mobile application are available at your observation in VIPS Logic test server.

Here together we learned functionalities of VIPS Observation mobile application and sync process with VIPS Logic test server.

There are some features are there which are also very interesting. Hope you will explore those features and enjoy the application. Please don't forget to let us know how you feel it and advise us for area of improvement.
